

# ArcGIS Online June 2026 Update: Known Issues, Workarounds, and Current Status

Release changes, reported issues, verification tests, workarounds, and current status for the June 2026 ArcGIS Online update.

JEFF FRANZEN • JULY 8, 2026 • INDEPENDENT RESEARCH

The June 2026 ArcGIS Online release added useful capability. It also produced an unusually wide set of community-reported issues across Dashboards, Map Viewer, Experience Builder, Field Maps, and Instant Apps.

The community roundup is not an official Esri root-cause bulletin. It is field intelligence. The affected functions to verify are pop-ups, coded domains, filters, edits, Dashboard selectors, Arcade expressions, labels, printing, attachments, offline sync, and automated UI tests.

## Primary Issue Areas

### EXPERIENCE BUILDER

#### Pop-ups and coded domains

Reports include missing attributes, BUG-000185982 Query widget Arcade failures, raw coded-domain values, related records not appearing, mobile-only failures, and unresolved cases after a production-fix notice.

### EXPERIENCE BUILDER

#### Filters and edits

Dynamic unique-value lists can go blank; the Edit widget has reports of requiring unrelated fields during simple updates.

### DASHBOARDS

#### Selectors, KPIs, formatting

Reports include selector freezes, missing reset behavior, advanced-formatting failures, gauge issues, and table summaries not honoring filters.

### ARCGIS ONLINE

#### Bulk editing

A July 6 thread reports mixed-value bulk edits can clear field values across selected records; Esri reproduced it and said a fix was expected July 7 or July 8.

# Official Release Changes That Matter

| SURFACE            | JUNE 2026 RELEASE CHANGES TO KNOW                                                                                                              | WHY IT MATTERS FOR TESTING                                                                                     |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Map Viewer         | Review map tool, custom print layouts, expanded authoring improvements, and beta Parquet feature layers from Data Pipelines.                   | The web map is the source for many downstream apps. Test it before blaming the consuming app.                  |
| Experience Builder | Translations, Language Switcher, Image Change Detection, QuickCapture, Chart improvements, Table multi-field edits, and Print custom layouts.  | The same release touched app runtime, widgets, printing, translation, editing, and field collection surfaces.  |
| Dashboards         | Performance work, Focus mode, indicator text scaling, data-driven rich text, selectors, bidirectional layouts, and feature pagination updates. | Dashboard changes can affect both viewer behavior and authoring behavior, even when the dashboard still opens. |

# Community-Reported Issues by Product

| PRODUCT            | REPORTED ISSUES                                                                                                                                                                                                                                                                 | CURRENT STATUS TO ASSUME                                                                                                                  |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Dashboards         | Smart Form Arcade expressions, selector freezes, BUG-000185924 separatorColor, labels, indicators, gauges, reset controls, table summaries, integer decimals, advanced formatting.                                                                                              | Several issues have BUG IDs or active discussion. Retest every briefing dashboard before using it as a source of truth.                   |
| Map Viewer / AGOL  | Intersect calculations, line labels dropping letters, Arcade First(), BUG-000185915 calculated expressions, BUG-000185883 and BUG-000185886 road labels, duplicated hosted-layer labels, bulk editing deleting field values, table pages, uploads, printing.                    | Check the source web map first. If Map Viewer or the layer edit surface is wrong, downstream apps are not the first place to debug.       |
| Experience Builder | Pop-ups missing content, BUG-000185982 Query widget Arcade content failures, domains showing raw codes, attachments showing file names, data actions, unique-value filters, point stacking, table styling, edit widget validation, version warnings, copy-paste, table sorting. | Highest-risk surface for deployed web apps. Retest pop-ups directly after any fix notice; some cases remained under investigation July 7. |
| Field Maps         | Offline edits, crashes while adding features, Arcade runtime warnings, attachments failing when pop-ups are configured, iOS crashes, list-field defaults, BUG-000186001 default values in offline areas.                                                                        | Test on real devices and offline areas. Do not infer field readiness from a web-map check.                                                |
| Instant Apps       | Portfolio app issues and general post-update instability reports.                                                                                                                                                                                                               | Test the public user path in a private browser, including mobile, search, click, print, and share.                                        |

## Issue Detail Matrix: Dashboards, Map Viewer, ArcGIS Online

| PRODUCT              | ISSUE                                   | REPORTED SYMPTOM                                                                                                                                                               | OPERATIONAL IMPACT                                                                                           | TEST NOW                                                                                                | STATUS / WORKAROUND                                                                                                                     |
|----------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dashboards</b>    | Smart Form Arcade expressions           | Community roundup lists Dashboards not honoring smart-form Arcade expressions after the release.                                                                               | Calculated labels, conditional display, or form-driven context can be wrong while the dashboard still opens. | Open each dashboard with a known feature and compare Arcade-driven output to the source form/map.       | Treat as active field intelligence unless your app tests clean. Simplify or precompute critical values for briefings.                   |
| <b>Dashboards</b>    | Category selectors freezing or crashing | Roundup lists category selectors causing freeze/crash behavior; replies also mention category selector issues.                                                                 | A leadership dashboard can become unusable only after a user interacts with the selector.                    | Select, multi-select, clear, reset, and repeat each category selector against a known count.            | Use static filters or narrower selector values temporarily for critical dashboards.                                                     |
| <b>Dashboards</b>    | BUG-000185924 separatorColor            | List widget separatorColor no longer respects advanced formatting.                                                                                                             | Priority separation, status grouping, or visual triage cues can disappear or mislead.                        | Check every list widget using advanced formatting and compare before/after screenshots.                 | Confirmed BUG ID in roundup. Remove fragile separator styling or use simpler visual grouping until fixed.                               |
| <b>Dashboards</b>    | Reset, summaries, indicators, gauges    | Roundup lists missing category reset, table summaries ignoring filters, indicators/icons issues, gauge maximum-value issues, integer decimals, and broken advanced formatting. | The displayed number can look polished but no longer match the filtered source data.                         | For each KPI, apply a known filter and verify the number against a table or REST query.                 | Add manual count checks. Simplify indicators for any dashboard used in a live briefing.                                                 |
| <b>Map Viewer</b>    | Line labels dropping letters            | A line-label thread reports letters disappearing inside labels across Center/Above/Below placements, zooms, fonts, simplified geometry, Edge, and Chrome.                      | Road, river, facility, or boundary labels can become unreadable in maps, StoryMaps, and derived apps.        | Pan/zoom known line features with label placement variants and compare to saved label text.             | Esri contributor said the issue was being investigated for a patch. Avoid publishing label-critical products without screenshot review. |
| <b>Map Viewer</b>    | Arcade and calculated expressions       | Roundup lists Intersect calculations, Arcade First(), and BUG-000185915 for calculated Arcade expressions breaking with free text entry.                                       | Derived values can be wrong at the exact point where users expect the map to interpret raw data.             | Run known Arcade examples and compare to pre-release or manually calculated expected values.            | Temporarily persist critical calculated values into fields or simplify expressions for operational apps.                                |
| <b>Map Viewer</b>    | Road and hosted-layer labels            | Roundup lists BUG-000185883 and BUG-000185886 for road labels, plus hosted-layer labels duplicating.                                                                           | Public and operational maps can show cluttered, missing, or duplicated location context.                     | Check basemap/road labels and hosted-layer labels at operational zoom levels.                           | Use alternate labels, scale ranges, or a simpler label class if labels are required for operations.                                     |
| <b>ArcGIS Online</b> | Bulk editing deleting values            | A July 6 thread reports mixed-value bulk edits can select the first data box and clear that field across all selected records.                                                 | Editors can unintentionally erase operational attributes across many selected records.                       | Run bulk edits only on disposable copies; test mixed-value selections before editing production layers. | Esri reproduced it and said a fix was expected July 7 or July 8. Pause important bulk edits until verified.                             |
| <b>ArcGIS Online</b> | Tables, uploads, printing               | Roundup lists feature-layer table pages not presenting data, document/PDF upload issues, and printing issues after the update.                                                 | Data QA, documentation attachment, and hard-copy briefing workflows can fail outside the map view.           | Open the layer table, upload a test PDF, and run the exact print layout used for briefings.             | Use alternate export or print paths only after verifying they preserve the needed fields and scale.                                     |

# Issue Detail Matrix: Experience Builder, Field Maps, Instant Apps

| PRODUCT            | ISSUE                                     | REPORTED SYMPTOM                                                                                                                                                                                                            | OPERATIONAL IMPACT                                                                                              | TEST NOW                                                                                                        | STATUS / WORKAROUND                                                                                                                      |
|--------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Experience Builder | Pop-up fields and Arcade                  | Threads report title-only pop-ups or missing fields while the web map displays correctly. BUG-000185982 covers Query widget pop-ups failing to display Arcade content configured with an if statement.                      | Users may trust a feature click or Query result that hides the Arcade-derived attributes needed for a decision. | Test Map Viewer, Map widget, Query widget, Feature Info, cache-cleared desktop browsers, and mobile devices.    | Esri said the fix was in production, then said some cases were not fully addressed and remained under investigation July 7.              |
| Experience Builder | Domains and related records               | A thread reports raw coded values, missing related records, and pop-up freeze behavior for services referenced from ArcGIS Server.                                                                                          | Non-GIS users can see codes instead of labels, and related inspection/status records can disappear.             | Compare the same feature in Map Viewer, Experience Builder pop-up, Near Me, Table, and List.                    | One report found hidden geometry fields tied to freeze behavior; domain display remained active. Check service schema before rebuilding. |
| Experience Builder | Filter widget unique values               | Users report "All unique values of this field" lists going blank; recreating filters did not fix it. Published/referenced services appear repeatedly in reports.                                                            | Blank values can look like no counties, chapters, statuses, facilities, or records exist.                       | Test every dynamic filter against a known source count; compare hosted layers to referenced/published services. | Use predefined values for critical filters. A sample app was posted for verification in the thread.                                      |
| Experience Builder | Edit widget validation                    | Thread reports the Edit widget asking for values in every field when only one or two fields are being updated.                                                                                                              | Users may enter dummy data to save, contaminating the layer.                                                    | Update one optional field and save without touching hidden, nullable, or unrelated fields.                      | Esri contributor said the issue was logged internally as a bug. Pause affected editing workflows.                                        |
| Experience Builder | Tables, lists, copy-paste, point stacking | Roundup and replies list data actions not selecting table data, table header styling, table sort order not honored, copy-paste failures, and point stacking issues.                                                         | Record review, map-table coordination, date ordering, and app maintenance can quietly fail.                     | Test list-to-table actions, table-to-map selection, date sort, copy-paste in builder, and point display.        | Add visible last-updated/date checks; preserve layout evidence before rebuilding widgets.                                                |
| Field Maps         | Offline submit edits                      | One Field Maps thread initially appeared tied to the June update, but the accepted solution found the device date/time had been set in the past.                                                                            | This is a useful false-positive example: not every post-update symptom is a platform regression.                | Check device date/time, app version, offline area age, sync timestamp, and layer edit settings.                 | Resetting device date/time resolved that case. Keep it in the triage checklist before blaming AGOL.                                      |
| Field Maps         | Attachments, defaults, crashes            | Roundup lists crashes while adding features, Arcade runtime warnings, attachments failing when pop-ups are configured, iOS crash reports, list-field default errors, and BUG-000186001 for default values in offline areas. | Field evidence, default attribution, and offline collection can fail where staff cannot easily troubleshoot.    | Create online, create offline, add photo, sync, then verify values and attachments downstream.                  | Rebuild offline areas only after evidence. Check app/runtime version and disabled-field default behavior.                                |
| Instant Apps       | Portfolio and general update issues       | Roundup lists Portfolio Instant App not working properly and general Instant Apps update issues.                                                                                                                            | Public viewers can fail in audience-facing paths even if the item page and source map look fine.                | Test public URL in a private browser: search, select, filter, click, print/share, and mobile layout.            | Use a temporary web map or alternate app link if a public app is affected during triage.                                                 |

---

## Operationally Important Issue Details

- 1 Experience Builder pop-ups can appear partially broken.**  
Reports describe title-only pop-ups, missing attributes, BUG-000185982 Query widget Arcade content failures, raw coded values, missing related records, mobile-only failures, and unresolved cases after a production-fix notice. Test Map Viewer, Map widget, Query widget, Feature Info, desktop browsers, and mobile. Capture evidence before clearing cache.
- 2 Referenced or published services may be a risk pattern.**  
Filter-widget reports repeatedly mention published or referenced services, while hosted data appeared less affected in at least one report. Compare hosted layers and published services before moving data or rebuilding apps.
- 3 Edit widgets can create bad data, not just bad UX.**  
If an edit surface asks for unrelated required fields, pause editing. Do not let users enter placeholder values just to save. Test the same edit in Map Viewer or Field Maps before using it as a temporary path.
- 4 Dashboard numbers need independent checks.**  
Selector, summary, indicator, gauge, and advanced-formatting issues can leave a dashboard looking polished while showing the wrong operational answer. Compare at least one filtered count with a table, query, or source total.
- 5 Bulk editing can delete values across selected records.**  
A July 6 ArcGIS Online thread reports mixed-value bulk edits clearing a field across all selected records. Esri reproduced it and said a fix was expected July 7 or July 8. Pause important bulk edits until verified.

---

## Practical Workarounds

### POP-UPS

Try Edge, private browsing, mobile checks, and Chrome cache clearing only after screenshots. If Query widget pop-ups fail but Feature Info works, use the verified path temporarily and preserve evidence for support.

### FILTERS

Replace critical dynamic unique-value filters with predefined values. Keep a known-count table or REST query beside important operational filters.

### DASHBOARDS

Simplify fragile advanced formatting. Add manual count checks for briefings. Do not let one styled KPI carry the whole truth.

### BULK EDITS

Use disposable copies for tests. Avoid mixed-value selections on production layers. Keep a rollback export before any required bulk edit.

# Release Test Plan

| TEST               | WHAT TO DO                                                                                                                      | PASS CONDITION                                                                                                                    |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Source data        | Open the layer endpoint or table. Check records, fields, domains, attachments, related tables, and counts.                      | Expected records and schema are present.                                                                                          |
| Map Viewer         | Open the source web map. Test labels, Arcade, pop-ups, forms, tables, attachments, print, and calculated fields.                | Labels, Arcade output, pop-ups, forms, tables, attachments, print output, and calculated fields match expected configuration.     |
| Experience Builder | Click normal features, domain features, related-record features, attachment features, filters, tables, lists, and edit widgets. | Configured pop-ups, filters, tables, lists, and edit widgets return expected values, counts, selections, and validation behavior. |
| Dashboards         | Test selectors, reset controls, gauges, indicators, table summaries, rich text, focus mode, and advanced formatting.            | Dashboard totals match independent counts.                                                                                        |
| Field Maps         | Create online, create offline, add attachment, sync, and confirm downstream visibility.                                         | Submitted records, attachments, default values, and synced edits are visible in the expected downstream layers and apps.          |

# Sources Reviewed

**Esri official release context:** What's new in ArcGIS Online, June 2026; ArcGIS Online Help "What's new"; Experience Builder Help "What's new."

**Community roundup:** ArcGIS Online June 2026 Update - Known Issues (Community Thread Roundup), posted June 30, 2026.

**Representative issue threads:** Experience Builder pop-ups/domains/related records; BUG-000185982 Query widget pop-up Arcade content; Experience Builder pop-up attributes missing compared with web map; Filter widget "All unique values"; Experience Builder Edit widget behavior; ArcGIS Online bulk editing deleting field values.

**Authority note:** Community reports are useful field intelligence. Confirm active production risk through your own reproducible tests, Esri Support, status pages, or confirmed BUG IDs.

# Validation Criteria

| AREA           | MINIMUM VERIFICATION RESULT                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source data    | Expected records, fields, domains, attachments, related tables, and counts are present.                                                                        |
| Web map        | Labels, Arcade expressions, pop-ups, forms, tables, attachments, print output, and calculated fields render as configured.                                     |
| Apps           | Critical pop-ups, filters, tables, selectors, edit forms, and mobile layouts complete the configured user workflow without missing values or incorrect counts. |
| Field workflow | Online and offline create/edit/attachment/sync tests complete and the submitted record is visible in downstream views.                                         |
